1	Цель работы	3
	1.1 Задание	3
2	Выполнение работы	4
	2.1 Описание работы интерфейса	4
3	Вывод	11
П	РИЛОЖЕНИЕ	12

# 1 Цель работы

Изучить методы программирования интерфейсов пользователей.

# 1.1 Задание

Для выбранного варианта задания спроектировать слой доступа к данным информационной системы с использованием шаблонов проектирования. Слой доступа к данным должен обеспечивать, выборку, вставку, модификацию и удаление записей в таблицах базы данных.

#### 2 Выполнение работы

В итоговом Flutter проекте интерфейс интегрирован с базой данных, обеспечивая взаимодействие клиентской и серверной Ktor частей. Мы изолировали бизнес-логику от базы данных с помощью преобразователя данных для улучшения архитектуры и масштабируемости. Использовали следующие подходы:

- 1. Единица работы: сохранение всех изменений профиля пользователя в одной транзакции.
- 2. Внешние ключи: каждая конференция связана с определённым организатором через organizer\_id.
- 3. Таблицы ассоциаций: таблица conference\_topic сопоставляет многие конференции с множеством тем.
- 4. Сценарии транзакций: сценарий для регистрации пользователя на конференцию, включающий проверку доступных мест.
- 5. Шлюзы таблицы данных: ConferenceService управляет операциями чтения и записи в таблицу конференций.
- 6. Преобразователи данных: преобразование данных пользователя из базы данных в объект User.

### 2.1 Описание работы интерфейса

На этом экране пользователь видит форму для входа в систему. Она содержит поля для ввода имени пользователя и пароля, а также кнопку для подтверждения входа. Этот интерфейс обеспечивает безопасную авторизацию, после которой пользователи получают доступ к функциональности приложения, включая просмотр и управление конференциями.

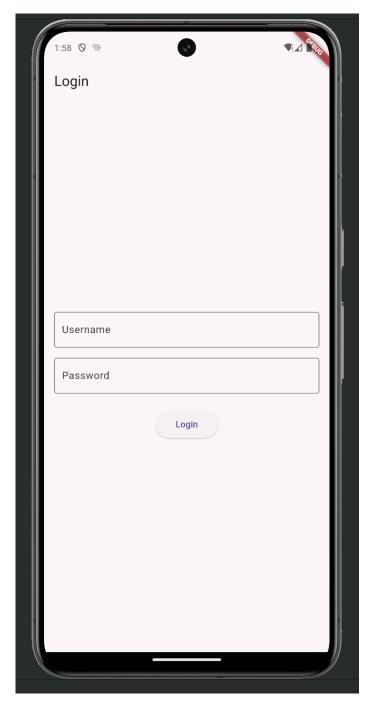

Рисунок 2.1 - Форма логина

Этот экран представляет собой основной список всех доступных конференций, доступных для пользователя. Здесь можно увидеть основную информацию по каждой конференции, включая название, дату и тему. Экран также предоставляет возможность быстрого доступа к детальной информации о каждой конференции посредством простого нажатия на соответствующую строку в списке.

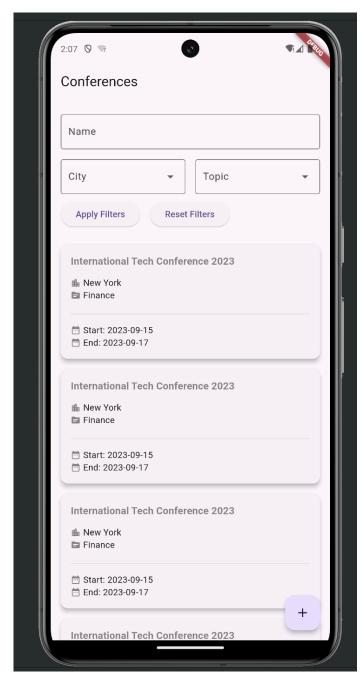

Рисунок 2.2 - Список конференций

На данном экране пользователи видят полную информацию о выбранной конференции. Блоки данных содержат детали, такие как даты проведения, местоположение, описание и контакты организаторов. Интерфейс также предлагает операции редактирования и удаления конференции, если они разрешены для текущего пользователя.

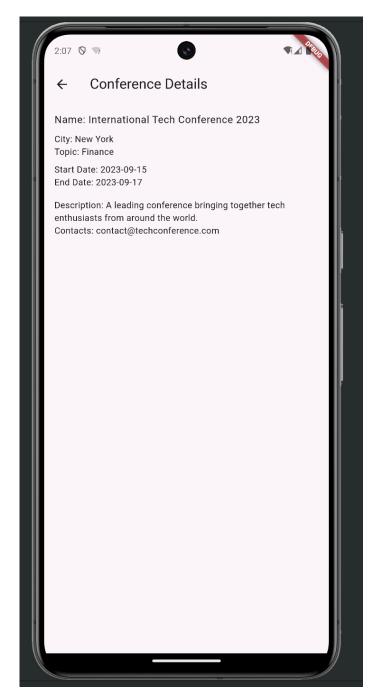

Рисунок 2.3 - Информация о конференции

Этот экран демонстрирует окно настройки фильтрации списка конференций. Пользователь может выбрать параметры фильтрации, такие как даты, тема или город, чтобы сузить отображаемый список конференций. Этот функционал помогает пользователям быстро находить и получать доступ к наиболее релевантным для них конференциям.

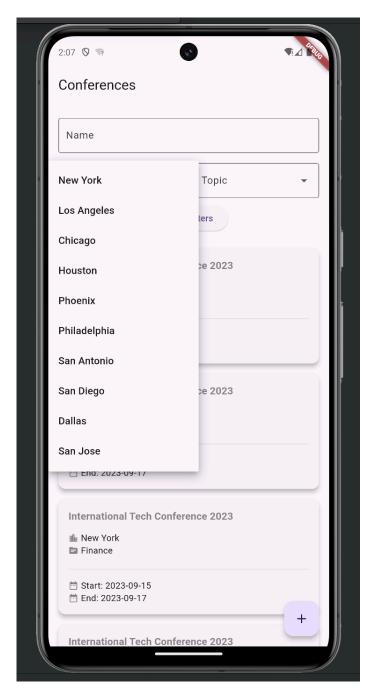

Рисунок 2.4 - Настройка фильтрации

После настройки фильтров пользователь возвращается на основной экран со списком конференций, где теперь отображаются только те конференции, которые соответствуют установленным критериям. Это подчеркивает удобство использования и персонализацию отображаемого контента.

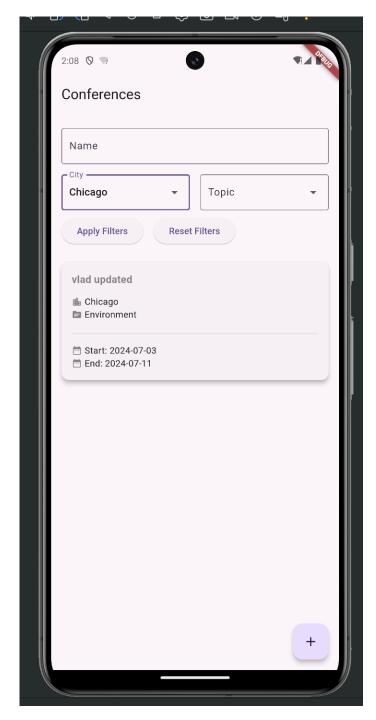

Рисунок 2.5 - Применение фильтрации

Этот скриншот показывает диалоговое окно, появляющееся в ситуации, когда происходят ошибки, например, при авторизации или подключении к базе данных. Диалог содержит сообщение об ошибке и инструкции по устранению проблемы, а также кнопку для закрытия окна. Такое окно позволяет пользователям быть в курсе возможных проблем и предпринимать соответствующие действия для их решения.

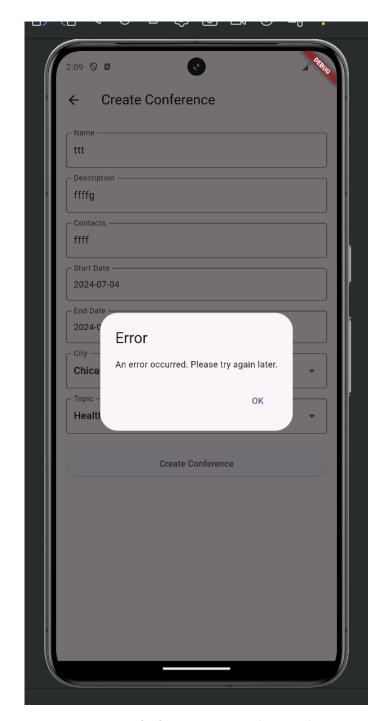

Рисунок 2.6 - Диалог об ошибке

# 3 Вывод

В ходе выполнения лабораторной работы был разработан внешний интерфейс пользователя в статическом прототипировании с использованием Flutter и Ktor. Полученная программа полностью работоспособна и вза-имодействует с базой данной в рамках используемых шаблонов.
